Your Body Composition Overview

Date 04-09-2025 Sport Triathlon-Cycling Athlete Sullivan Middaugh Coach Parker Spencer

The graphs and the table show your actual body composition

Please pay close attention to the body fat, and fat free values. In most sports it is desirable to achieve a low body fat percentage (= high fat free mass). However, with body fat, there are inter-individual differences of what the best value is. The lowest possible value, may not always be the desired goal.

Body Mass	68.5 kg
Body Height	193.0 cm
Body Mass Index	18.4 kg/m2
Projected BSA	1.935 m2
Body Fat	11.1 % of body mass / 7.6 kg
Fat Free	88.9 % of body mass / 60.9 kg

Your Load Characteristics Overview

Work-only related steady state characteristics of key physiological metrics

Your Key Performance Metrics

Date 04-09-2025 Sport Triathlon-Cycling Athlete Sullivan Middaugh Coach Parker Spencer

VO2max - maximum aerobic power

Absolute: **5994** ml/min
Relative: **87.50** ml/min/kg

VLamax - maximum glycolytic power

VLamax: **0.79** mmol/l/s

AT - Anaerobic Threshold (MLSS)

Absolute: **369** Watt
Relative: **5.39** Watt/kg
%VO2max: **77.0** %

Fatmax - maximum fat metabolism

MFO Absolute: **558** kcal/h
MFO Relative: **8.14** kcal/h/kg
Fatmax: **240** Watt

Carbmax - carbohydrate metabolism

Absolute: **244** Watt
Relative: **3.56** Watt/kg

Available Glycogen g/kg

Absolute: **531** g
Relative: **7.75** g/kg

Heart Rate

Maximum: -
PWC150: -

VO2max: is a proxy for your aerobic power. The maximum rate of oxygen uptake is proportional to the maximum energy production in the aerobic metabolism. In almost all sports it is desirable to have a high VO2max, enabling a high power production by aerobic metabolism.

VLamax: a proxy for your glycolytic (anaerobic) power. The maximum rate of lactate production is proportional to the maximum energy production in the glycolytic (anaerobic) metabolism of your muscles. For endurance events, such as an Ironman, or a Marathon, a low VLamax is desirable. In events which include sprinting or short intense bouts, a higher VLamax is associated with higher performance.

Anaerobic threshold (AT) AKA maximum lactate steady state (MLSS). MLSS marks the intensity (speed or power) at which the production rate of lactate in the muscle equals the clearance rate of lactate. AT marks the highest possible intensity, which can be sustained without accumulating lactate.

FatMax marks the highest fat oxidation rate. Simplified, this is the maximum amount of energy (kcal) from fat combustion per hour.

CarbMax marks the intensity (speed or power) at which the combustion of carbohydrates reaches 90g per hour.
